

ABSTRACT

A data mining system directed to industrial applications gathers data remotely from a plurality of industrial plants or sites and makes the gathered data available over a network to a user running a data mining application or on-line analytical process means to generate and, if desired, visualize results. Access to a service of this nature may be made available in connection with an on-line service, such as a website, that also provides access to industrial products and services. Subscribers to the on-line service, who may be charged a fee to subscribe, may be given an incentive to continue their subscription in the form of an offer of free or reduced-cost access to the above-described data mining system during their on-line service sessions.
